C++ and Unreal Engine 5. Two years contracting on a networked co-op survival game, extending single-player systems with server-authoritative replication. Recent work has gone lower level: native DLL mods, binary patching, and an undocumented save format reverse-engineered from scratch. Available for contract work, part-time or full-time.

WORK EXPERIENCE

Contract Gameplay Programmer , <i>Project Horizon</i>	03/2023 – 08/2025 Remote
- Made a commercial survival framework and a library of marketplace plugins work as one game in networked co-op, extending bought single-player systems with server-authoritative replication. - Built skill tree and XP progression almost entirely from a bare menu shell: perks wired into character stats, server-validated unlocks mirrored to every client and HUD. - Modular clothing with replicated mesh and material swaps, plus a 195-item content database. - Integrated marketplace vehicles: replicated damage and destruction, passenger ejection, save/reload persistence. Code under a confidentiality agreement.	
Assistant Lecturer, Computer Science , <i>Ivan Franko State University</i>	01/2025 – Present Zhytomyr, Ukraine
Teach Computer Science labs and practicals to undergraduate students.	

EDUCATION

Bachelor of Education in Informatics , <i>Ivan Franko State University</i>	09/2019 – 06/2023
Master of Education in Computer Science , <i>Ivan Franko State University</i>	09/2023 – 12/2024
PhD in Computer Science (Focus: Engine Replication) , <i>Ivan Franko State University</i>	10/2025 – Present

PROJECTS

KCD Switch → PC Save Converter , <i>Python</i>	07/2026 – 08/2026
Reverse-engineered an undocumented CryEngine save format to move a full Switch playthrough onto PC, where no prior tooling existed. Ships as a drag-and-drop exe ~20s per save.	
KCD Permadeath , <i>C++, Lua</i>	08/2026
Native proxy DLL adding permadeath to a game whose scripting API has no file I/O and no death event. Finds the game-over function by signature scan, refusing to patch ambiguous builds. Shipped on Nexus Mods 🔗	
Slick 9 , <i>UE5, C++ · 9-day jam, 4 devs</i>	02/2026
Custom movement component: momentum-preserving wallrun, slope-driven acceleration, runtime shape-shifting with predictive collision checks.	

SKILLS

Programming C++17 · C# · Python · Lua	Gameplay Network replication and server-authoritative design · character movement · save/serialisation · progression and inventory systems	Low level Reverse engineering · binary formats · native DLL modding · 3D vector math
Engines/Tools Unreal Engine 4/5 (C++ and Blueprints) · Unity · Git · Visual Studio
